

## 1.9.1 GEAR LUBRICANTS

### 1.9.7 LUBDECO REACONDICIONADORES

This is an emery paste used in the cement and mining industry for gears (pinion and crown) found in furnaces and mills, so the contact between teeth sides can be increased, or the vibrations caused by valleys or slopes, or some other imperfections on the contact surface of teeth of both, the pinion and crown, can be lowered.

Part of the product grafokata acondicionador is diluted with 5 parts of low viscosity oil (thin), preferably with a ISO 46 viscosity.

When fully mixed, it is applied, by using an induced air gun, directly on the inlet or outlet operating pinion, as applicable, two pinions or one pinion. This is a continuous application for a term of several hours, getting satisfactory results.
